

Field latitude and Longitude in Decimal Degrees using Bing Maps

Dr. Gene Stevens, University of Missouri-Extension Service

Bing Maps is a simple way to find latitude and longitude in decimal degrees for your fields. But, the GPS function in Bing Maps currently only works on PCs (not Apple devices) with Mozilla Firefox or Explorer web browsers. To start, type www.bing.com/maps/ in the address box of your browser. Step 1 is to change Road view to Aerial view by clicking on the down arrow beside Bird's eye. Then move the cursor down to Aerial and select it.

Step 2. Find your field and Right click the mouse. A red dot and box will appear. The lat/long of the field is displayed in small white text on the second line of the gray area.
